

Objects

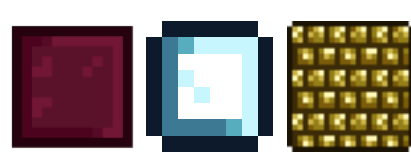

Player:
- Moves 1 Tile at a time
- 2 states: Corporeal (C), Incorporeal (I).
- Invisible when Incorporeal.
- Starts Incorporeal.

Human:
- Human moves 1 tile away from (C) player when in line of sight. (**Spooked**)
- When Blocked by wall, moves left from faced direction.

Mirror:
- Interactable: Toggles player state.

Wall:
- Walls have forms that interact uniquely with the players state.

Type:	Passible When (I)	See Through:
Normal	True	False
Rune	False	False
Window	True	True

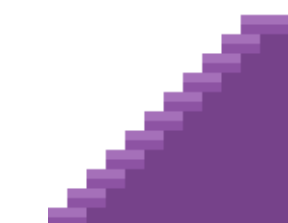

Hazard:
- Hazards either only hurt the human or hurt both the human and player.

Type:	Hurts Human	Hurts Player
Spike	True	False
Fire	True	True

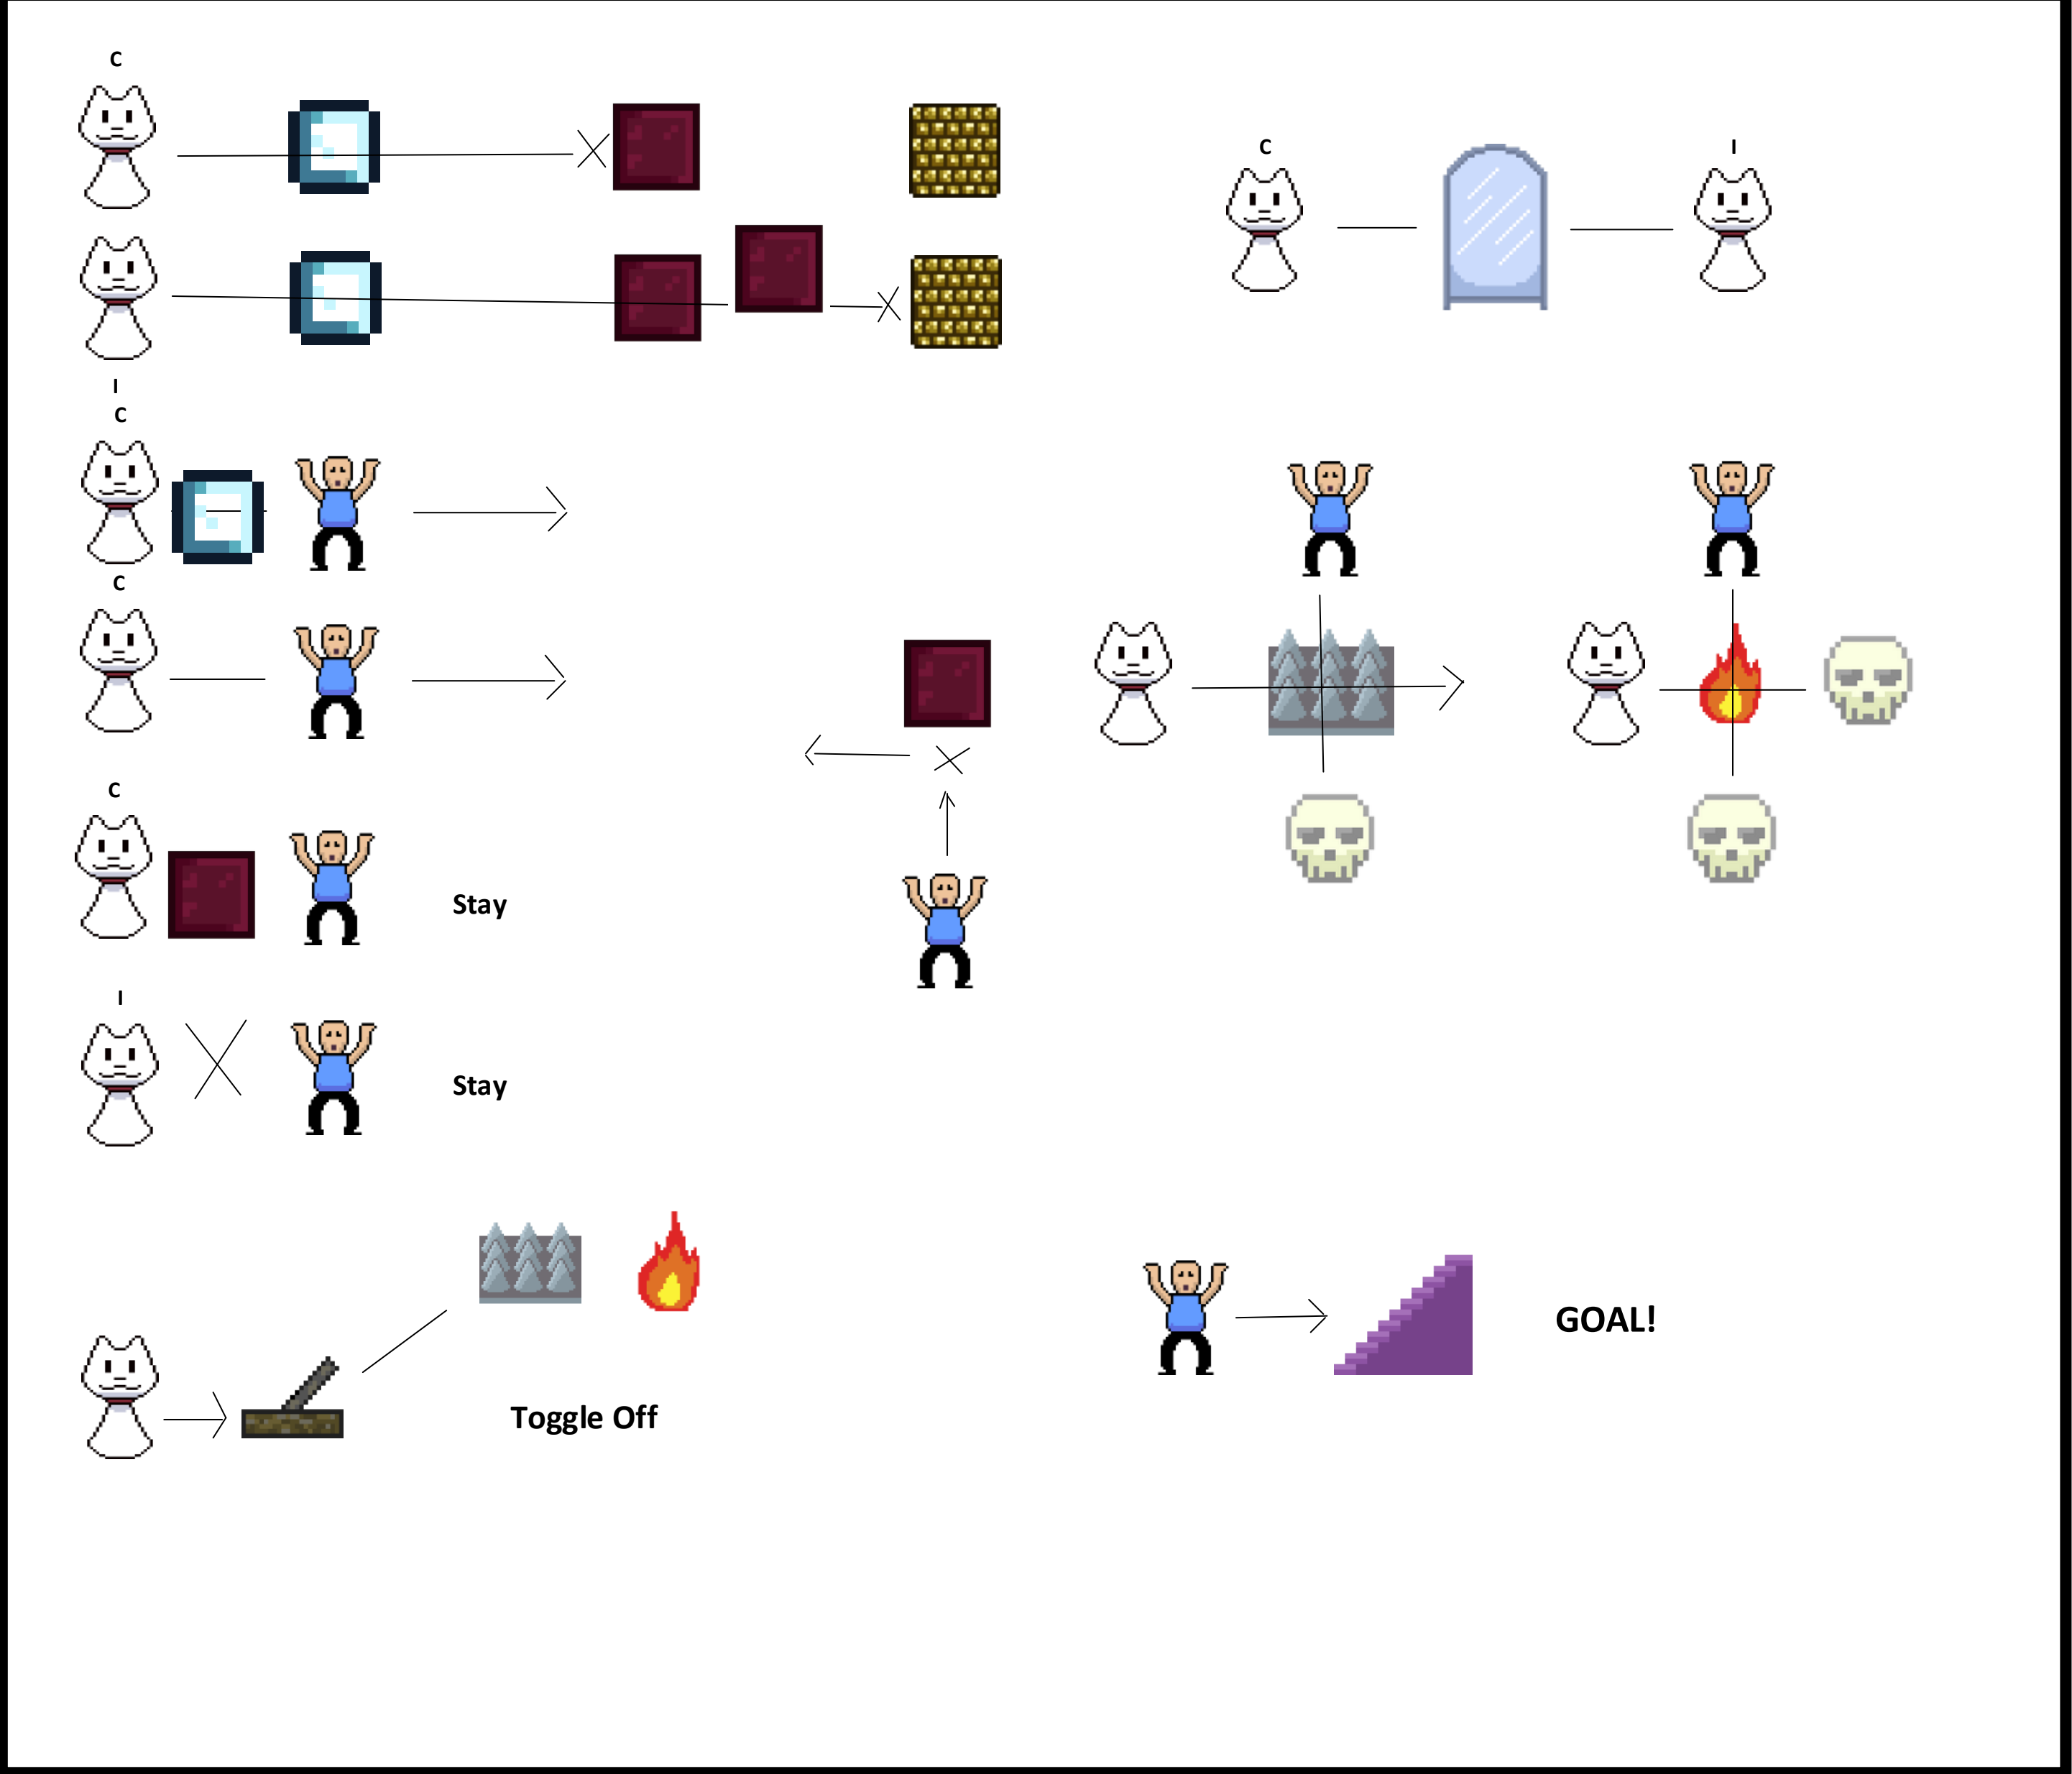

Lever:
- Can be **linked** to sets of Hazrd tiles.
- When interacted with, swaps linked Hazard Tiles with empty tiles.

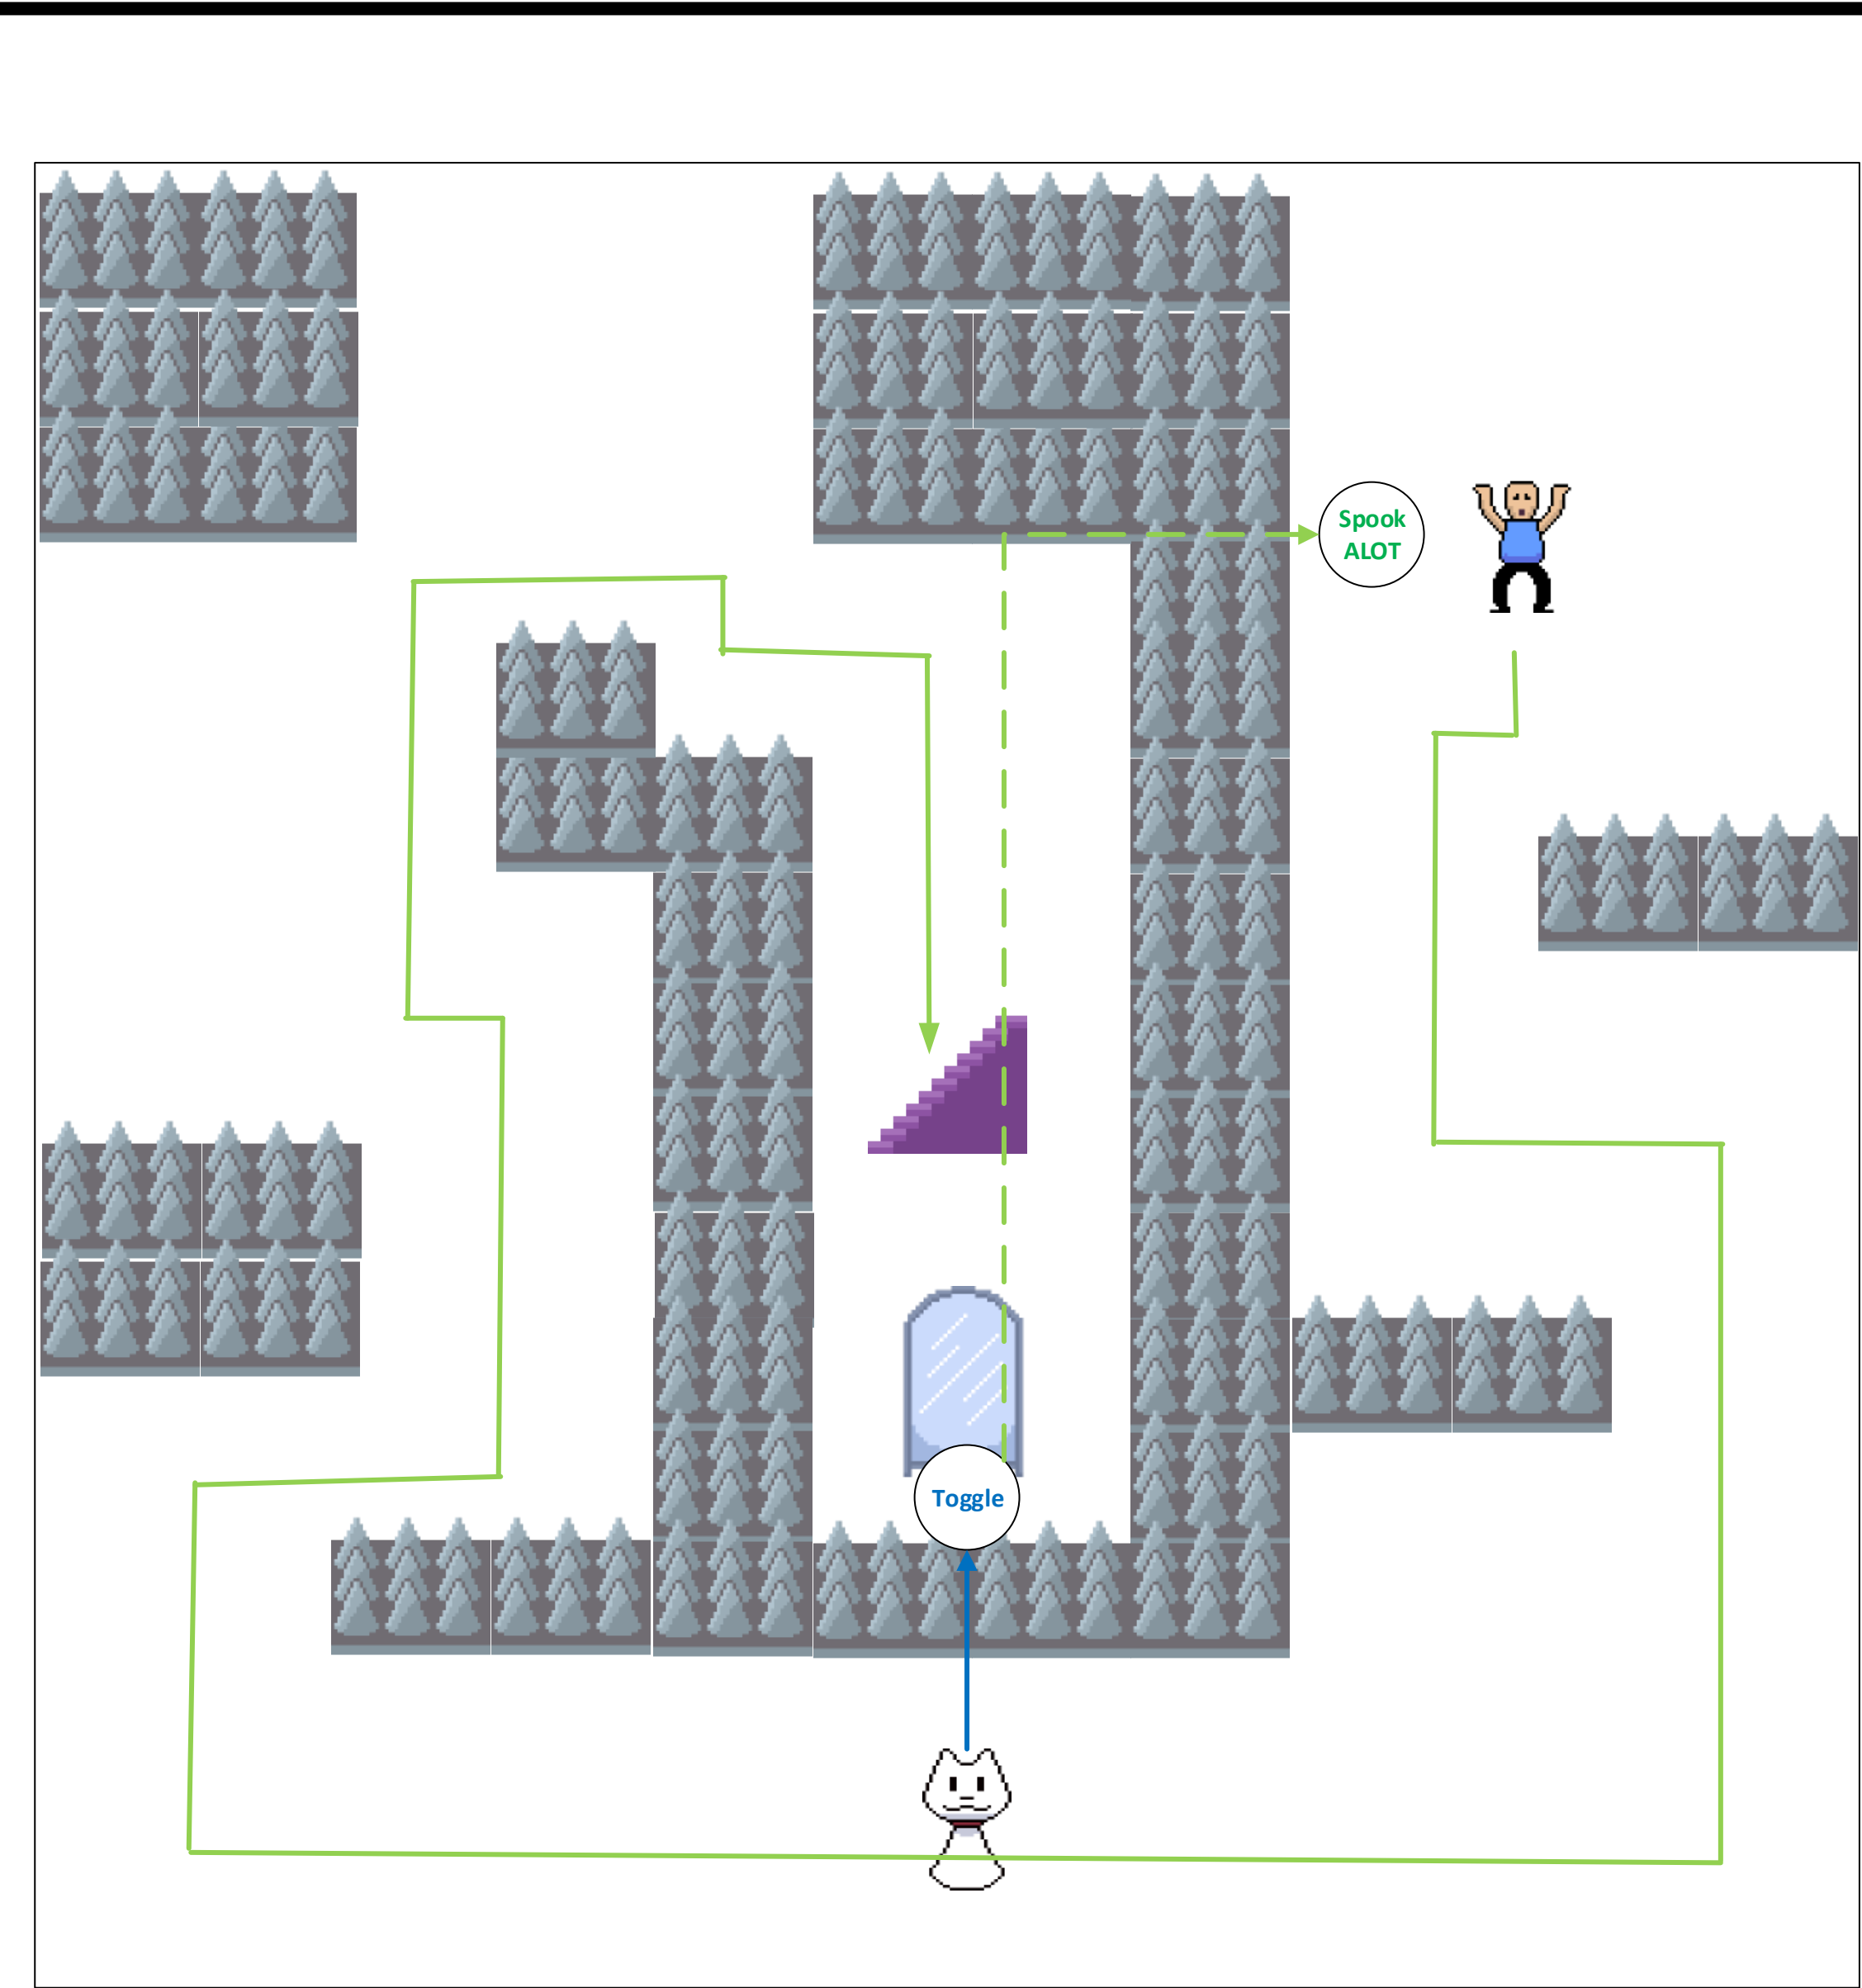

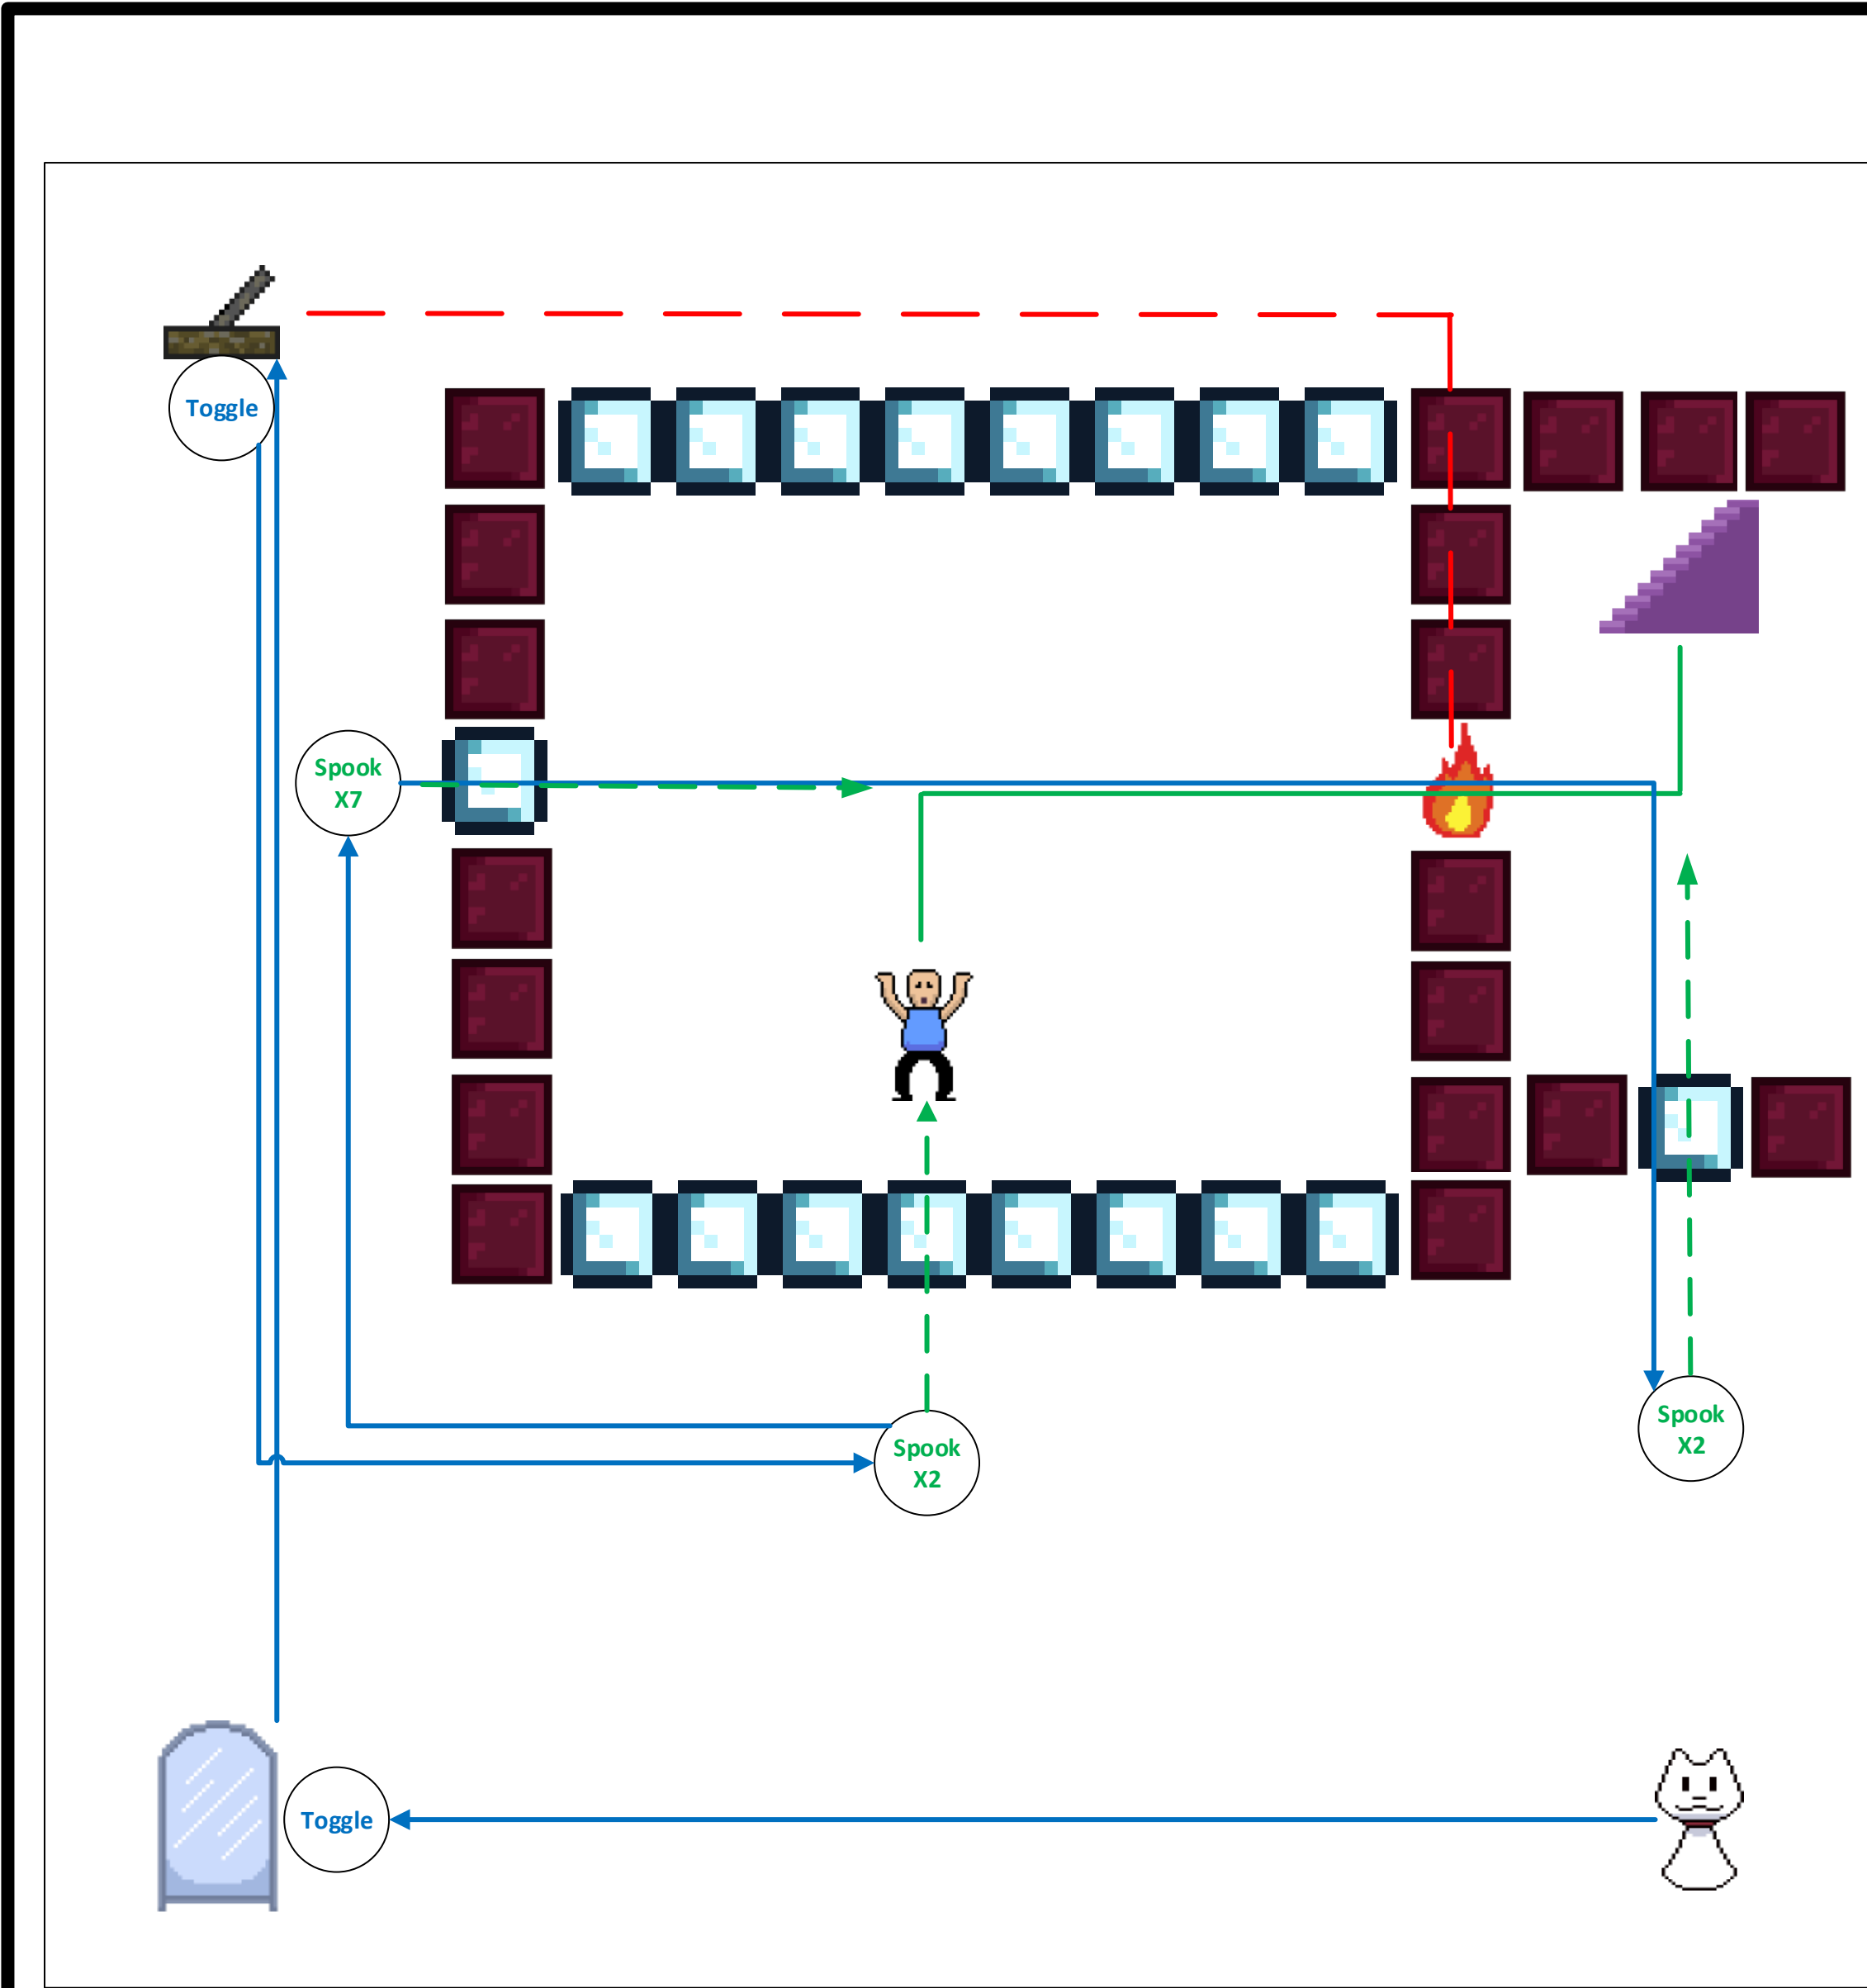

Exit:
- When overlapped by human, despawn human and add to "save count."

Interactions

Levels	
--------	--

Design Justification:

Mechanics:

Each event happens once when the player moves/interacts with the game. The game is made of tiles. Each object takes up 1 tile.

I gave the player two possible states that lead to a larger expansion of possible gameplay by nature. An incorporeal state lets the player navigate more of the level provided, while the corporeal state allows the player to interact with physical mechanics. This leads to the main challenges of the game. The mirror object acts as a way to restrict where the player can change states, leading to a more refined puzzle design/experience.

The human acts as part of the main goal for the player, moving 1 tile when seeing the player. This human must be sent to the goals. This gives the player their personal goal and since the human cannot pass through solid objects and can even die if interacting with hazards, the player can face a variety of difficult and complex challenges.

Hazards, as previously stated, harm humans and even players leading to complexity on their own. They also work in tandem with a lever object. This allows areas of the play-space to change in navigability for either the player or human objects. Changing the overall state of the level itself.

Finally, the different walls are useful in controlling movement of both the player and the human, acting as a set obstacle. The different possible interactions between the players in two states and the different walls leads to a complexity in navigation. One area can be accessed by an incorporeal player, while not so by a corporeal one. The rune walls specifically act as a complete obstacle, that cannot be removed, and helps create the borders of the play-space.

Overall Design:

I will admit, a couple of the objects and events I have added could have been removed, however I feel that a complete and fulfilling experience could only be properly achieved with all of them. With all of these different possible interactions, a vast array of puzzles can be created, akin to a sandbox game for those who enjoy creating said experiences. The levels I provided are a couple of examples of these puzzles, the first utilizing the different navigational blockades to lead to a more precise requirement of movement, while the other purely acts as an obstacle course. Much more can be done with this set of rules, utilizing larger play-spaces, more humans and of course, different combinations. I can't think of all the ideas, but I feel that's the point.
